1 Customer gives the requirements

A customer comes to our company and says:

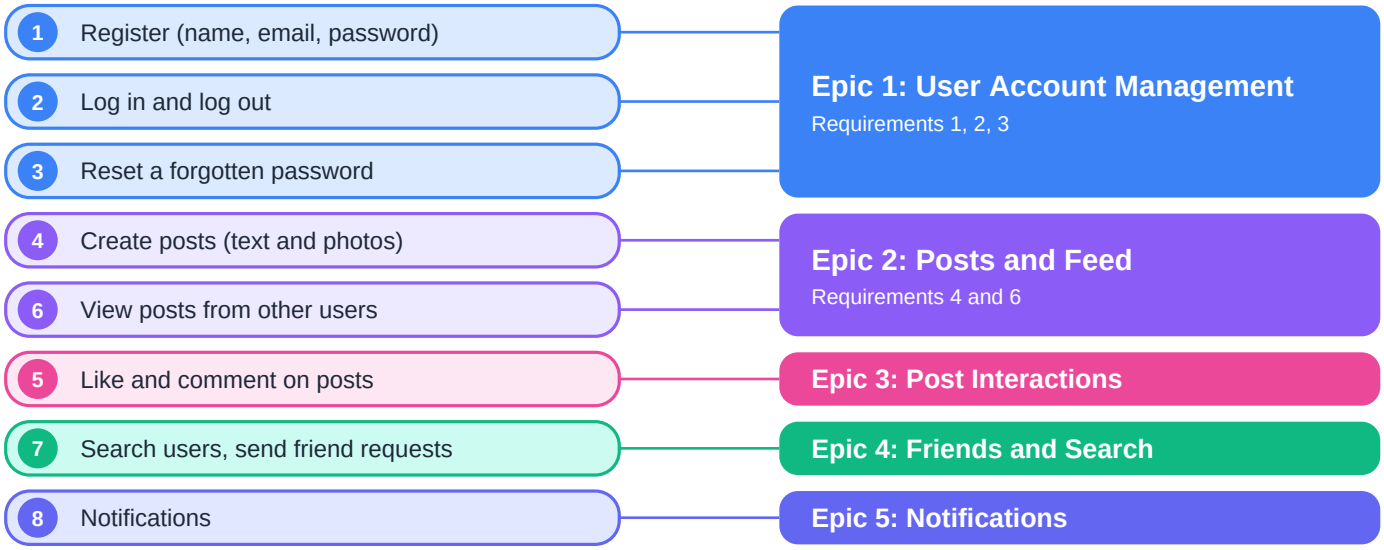
> “I want to develop a social media application similar to Facebook.”

1. New users should be able to register using their name, email, and password.
2. Registered users should be able to log in and log out securely.
3. Users should be able to reset their password if they forget it.
4. Users should be able to create posts containing text and photos.
5. Users should be able to like and comment on posts.
6. Users should be able to view posts from other users.
7. Users should be able to search for other users and send friend requests.
8. Users should receive notifications when someone likes or comments on their posts, or accepts their friend request.

The customer usually does not tell us the exact Jira Epics, Stories, Tasks, or Subtasks. Our team must analyze the requirements and organize the work.

2 How do we identify an Epic?

An **Epic** is a big feature area that contains several related User Stories. Look at the customer's eight requirements and group related ones together.



Epic	Requirements	Covers
Epic 1: User Account Management	1, 2 and 3	Registration, login, logout and password reset
Epic 2: Posts and Feed	4 and 6	Create posts, upload photos and view posts
Epic 3: Post Interactions	5	Like and comment on posts
Epic 4: Friends and Search	7	Find users and send friend requests
Epic 5: Notifications	8	Notify users about likes, comments and accepted requests

How to identify an Epic: ask, "What big feature area are we building?" and group requirements that belong to the same area. These are five reasonable Epics; another team might group some features differently depending on the product design.
